

#### Integrated Cost & Schedule Risk Analysis (ICSRA)

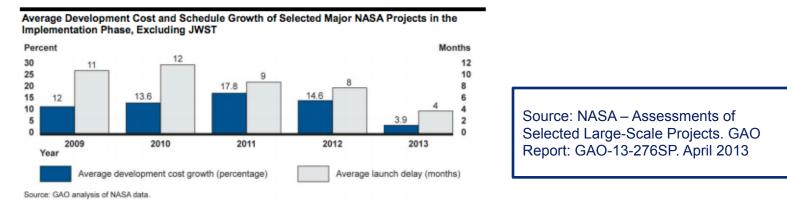

Improving Project Performance Through Advanced Risk Analysis

2014 ICEAA Conference – San Diego, CA

### ICSRA in government started at NASA to address the lack of integration of project control disciplines

- In 2009, NASA was facing a challenge of extraordinary cost and schedule growth across their portfolio of programs
- In response, NASA created their Joint Confidence Level (JCL) policy requiring programs be budgeted and planned based on integrated cost and schedule risk analyses.
- The JCL approach is the NASA name for Integrated Cost Schedule Risk Analysis or ICSRA.
- Impact of JCL policy was immediate and measurable: In 2013, the Government Accountability Office conducted an independent review of NASA programs finding cost growth and schedule delays had been reduced to 1/3<sup>rd</sup> of 2009 levels, mainly because of better estimating of cost and schedule taking into account project risks.

Hulett &

Associates

### **ICSRA typically involves four steps**

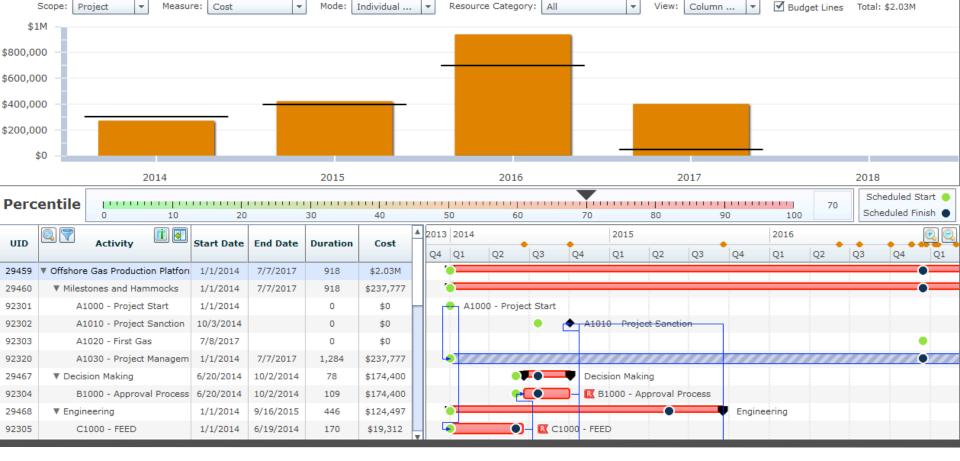

- 1. Integrate
  - ICSRA integrates cost estimates, schedules, and risk registers into a single analytical model, providing a cohesive view of the three project controls functions
- 2. Predict
  - ICSRA forecasts future cost and schedule growth allowing project managers to identify challenge areas and set reserve levels based on quantitative analysis
- 3. Analyze
  - Analysis should be used to identify lead sources of cost and schedule risk, empowering the project management team to identify actions for improving project performance
- 4. Mitigate

3

 Analysis should be set up so that project managers can run what-if analyses in realtime to test out impacts of mitigative actions

#### **ICSRA Model Demo**

#### **ICSRA** Training

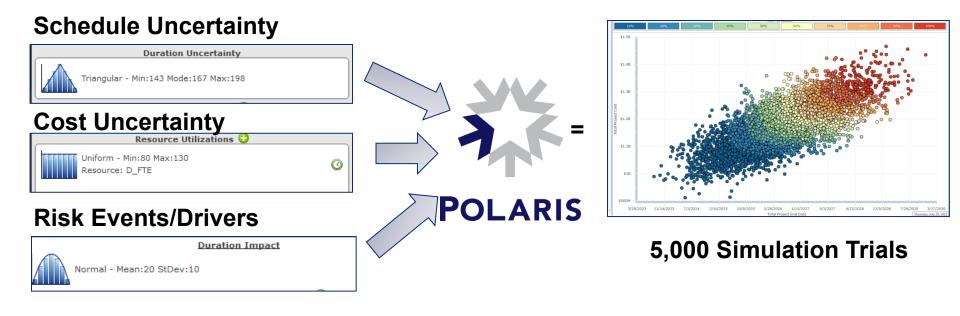

# Today's training will provide you with the opportunity to gain hands-on experience with one product optimized for ICSRA

- Training is not meant to be comprehensive but rather to provide a primer on how to perform an ICSRA
  - One, two, and three day ICSRA training courses including Polaris tool training are available from the Booz Allen Hamilton/Hulett & Associates team
  - Jumpstart consulting support is also available if you would like help standing up a ICSRA capability within your organization
- Agenda:
  - Fundamental theory of ICSRA
  - Preparing a schedule for ICSRA
  - Preparing a cost estimate for ICSRA
  - Preparing a risk register for ICSRA
  - Quantifying Uncertainty
  - Performing a ICSRA and analyzing the results

### ICSRA models are typically analyzed using Monte Carlo simulations with inputs described as distributions

- The fundamental theory of Integrated Cost Schedule Risk Analysis is:
  - If we can view cost, schedule, and risk as uncertain events, and assign probability distributions to them, then we can use Monte Carlo Simulations to predict their combined impact on project performance

Hulett &

Associates

#### Polaris uses a transparent and well documented methodology, endorsed by NASA and DoD and used by commercial companies, to predict cost and schedule growth

- ICSRA allows uncertainty to be defined around all of the project controls artifacts
- Schedule
  - Schedule uncertainty can be quantified around baseline durations
  - Uncertainty can represent inherent variability, estimating error and estimating bias
- Cost
  - Uncertainty can be applied around the burn rate for time-dependent costs and around the total cost for time-independent costs
  - Phasing profiles allow costs to be spread according to when they are likely to occur
- Risk
  - Risk events are quantified in terms of their probability of occurrence, and cost and schedule impacts to various tasks in the schedule should they occur
  - Risks can be applied as additive (discrete risks) or multiplicative (risk drivers)
  - Risks can be applied to multiple activities, and some activities will have multiple risks

### Baseline schedule shows the cost estimate, schedule, and risk register in a single cohesive view

#### **Preparing a Schedule for ICSRA**

Booz | Allen | Hamilton

Booz Allen Hamilton and Client Proprietary and Business Confidential.

# The schedule is the most important component of a ICSRA as it is the backbone to which all other artifacts will link

- ICSRA simulations flex the schedules according to the applied uncertainty distributions and the risks that occur on any iteration; to that end, schedules must be conditioned prior to use in a ICSRA
  - A comprehensive schedule health check should be run to ensure the schedule is of high-quality
  - The schedule must be logically linked with no dangling activities to ensure downstream impacts of duration growth are captured.
  - Fundamentally, the dates should be determined by the logic and durations of their predecessors so if predecessors change the dates may change logically
  - Hard constraints should be removed and converted to "as soon as possible" or "start no earlier than" to allow the schedule to flex
  - Non-realistic relationships (such as artificial ones created across contracts) should be removed
- Since the ICSRA will calculate risk, which can then be used to set reserves, reserve should be removed from the schedule and the cost estimate
  - Some organizations have a policy of including schedule reserve as tasks within the schedule
  - These should be removed as otherwise they can push the schedule out further than realistic

#### Polaris has a built-in health check to provide a quick-look assessment of the schedule's quality against DCMA guidelines

Metric	Score and Reason
E Cogic	5.3% (1/19 tasks) have a missing schedule relationship
🔁 Leads	0% (0/19 tasks) have lead time
🔁 Lags	0% (0/19 tasks) have lag time
🔁 Relationship Types	0% (0/19 tasks) have an improper schedule relationship
🗎 Hard Constraints	0% (0/19 tasks) have hard constraints
🗀 High Float	0% (0/19 tasks) have excessive float
🔁 Negative Float	0% (0/19 tasks) have negative float
High Duration	63.2% (12/19 tasks) have excessive duration
🗎 Invalid Forecast/Actual Dates	0% (0/19 tasks) have invalid dates
Carl Resources	0% (0/20 tasks) have improper resources assigned
🗎 Missed Tasks	0% (0/19 tasks) have missed their finish dates
🔁 Critical Path Test	0 day(s) of float
🗀 Critical Path Length Index (CPLI)	1 CPLI
Baseline Execution Index (BEI)	1 BEI. 0% (0/0 tasks) prior to the status date were not completed

To check the viability of the schedule is to check it against CPM best scheduling practices.

There are 3<sup>rd</sup> party software packages such as Deltek Acumen FUSE, Steelray and the Primavera Risk Analysis Schedule Check report.

Filters, sorts and groupings of activities in the native schedule package can also be used.

### Preparing a Cost Estimate for ICSRA

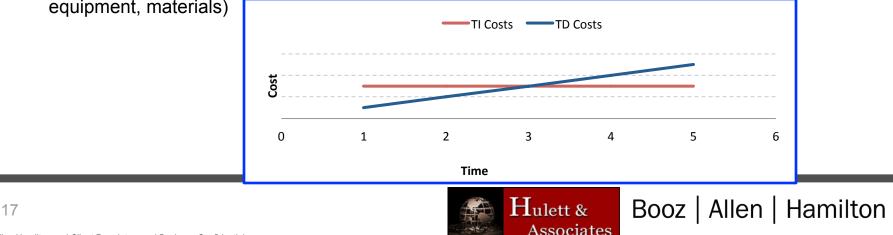

Booz | Allen | Hamilton

Booz Allen Hamilton and Client Proprietary and Business Confidential.

#### Mapping the cost estimate to the schedule ensures consistency across the artifacts and enables analysts to transition from a SRA to a ICSRA

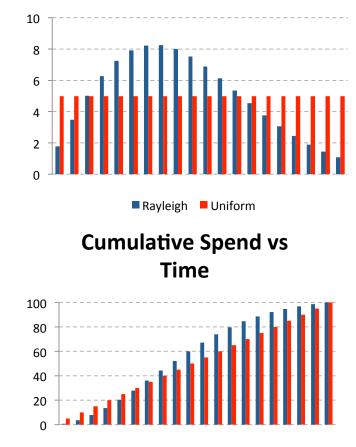

- The first step in importing a cost estimate for a ICSRA is mapping it to the schedule
  - Mapping is facilitated if the cost estimate and the schedule adhere to the same WBS
  - This mapping can be performed at any level although it is typically above the lowest level of detail in the schedule
  - This mapping typically uncovers inconsistencies between the two artifacts particularly if the schedule contains any resources - that should be corrected before the analysis continues
- Costs are then divided into one of two categories time-independent (TI) or timedependent (TD)
  - TD costs are those that grow and contract as the schedule grows and contracts (e.g., Labor, rented equipment)
  - TI costs grow and contract independently of the schedule (ignoring inflation effects) (e.g., installed equipment, materials)

### Mapping the cost estimate to the schedule ensures consistency across the artifacts and enables analysts to transition from a SRA to a ICSRA

- When Polaris imports a cost estimate it automatically converts it to a dollar/day burn rate that, when applied to the schedule, will replicate the cost estimate
- Selecting a phasing profile allows costs to be phased realistically as the schedule grows and contracts
  - Many of the commonly used cost estimating phasing profiles are included in Polaris
- As the simulation runs, Polaris calculates the cost impact of schedule growth
  - For each iteration, the cost is adjusted (up or down) according to the change in schedule and dollar/day burn rate
  - The cost is then dynamically re-phased according to the selected phasing profile to provide a realistic view of when costs are likely to occur

#### **Incremental Spend vs Time**

Rayleigh Uniform

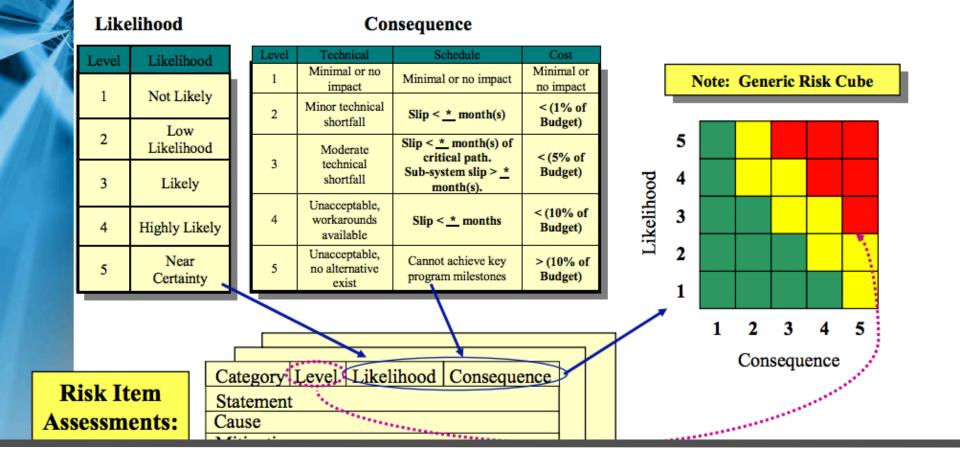

Polaris imports cost estimates from Project, Primavera, or Excel – the last of which allows costs to be entered at total value, which will then automatically be converted to burn rates

#### **Preparing a Risk Register for ICSRA**

#### Mapping the risk register to the schedule and cost estimates allows downstream impacts to be calculated and enables better risk mitigation

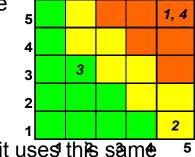

- All risk management methods result in the production of a "Risk Register" (or "Risk Log")
- Risk registers typically contain, at minimum, the following information for each risk:
  - Description of the risk; typically written as an IF-THEN statement
  - Probability, or likelihood factor, that the risk occurs
  - Impact, or impact factor, should the risk occur on the final milestone
  - Risk score (generally likelihood factor x impact factor)
  - Planned response should the risk occur, recovery impact
  - Mitigation plan for the risk, action before the risk occurs

- ICSRA, however, does require one additional, key-piece of information: the task within the schedule that is impacted by the risk
- This is how ICSRA gives far more insight into risks than the simple "risk score" metric

Hulett &

Associates

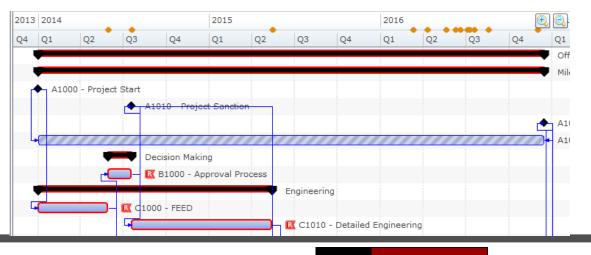

Booz | Allen | Hamilton

Likelihood

#### Mapping the risk register to the schedule and cost estimates allows downstream impacts to be calculated and enables better risk mitigation

- True ICSRA software allows the modeling of risks in many ways:
  - Each risk can impact multiple activities and a single activity can be impacted by multiple risks
  - Risk impacts can occur in serial or parallel depending on the type of risk
  - Risks can be discrete (additive to the duration) or drivers (multiplicative applied to duration). Risk impacts
    generally are specified in ranges, often using the 3-point estimate
  - Opportunities (uncertain events with a positive impact) can also be modeled
- Polaris' risk timeline allows projects to look at the risks temporally as well as to see where they are clustered within the schedule
  - This quickly identifies when/where the riskiest areas of the project are or where there may have been shortcomings in risk identification

Hulett &

Associates

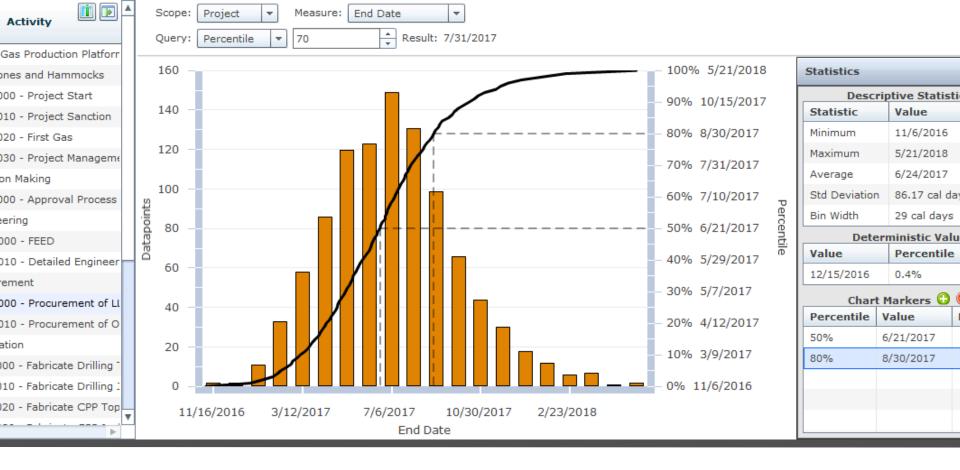

### Polaris imports the risk register from Excel or from enterprise risk management tools through Excel macros

#### **Quantifying Risk & Uncertainty**

Booz Allen Hamilton and Client Proprietary and Business Confidential.

#### How an analyst chooses to quantify uncertainty has the largest impact on the results in the model and is the most important piece of the risk analysis

- Analysts should use the three following methods, in decreasing order of preference, to quantify uncertainty distributions
  - The Math: Where analytical approaches (such as parametrics) have been used to develop the baseline estimate there is generally an associated method for quantifying uncertainty
  - The Data: Statistical analysis can be performed on an organizations historical data to quantify the uncertainty around the estimate or the likelihood of occurrence/impact of a risk
  - SME Judgment: Subject Matter experts can also provide uncertainty distributions so long as their input is carefully gathered and incorporated into the model (see next slide)
- True ICSRA software incorporates a wide array of probability distributions, quantified in both days and as a percentage of the baseline duration, to provide a wide range of options for accurate modeling
- Of late there has been a shift in some tools to move away from quantitative analysis and towards more qualitative (high-medium-low) levels of risk
  - While quick, these approaches lack transparency and the ability to leverage organizational data for more accurate modeling

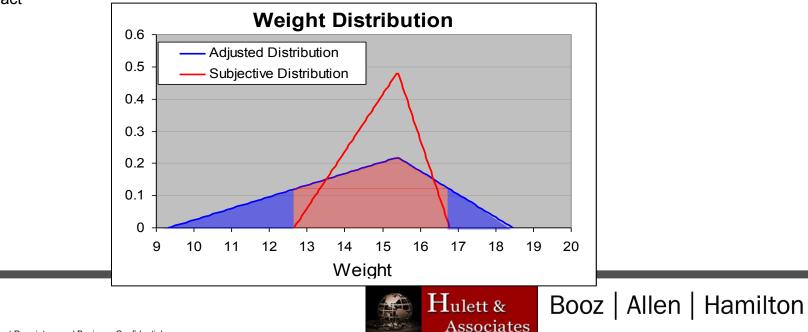

Hulett &

Associates

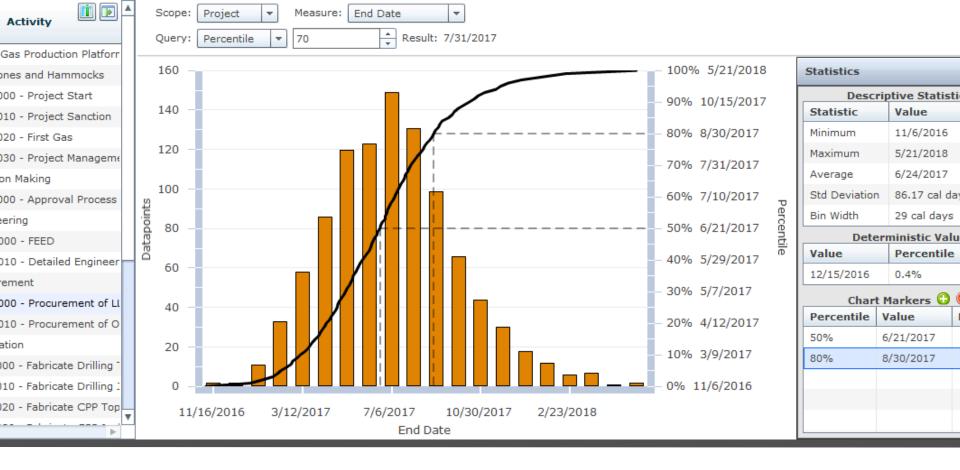

# Where SME judgment has been used to develop a distribution, be careful to correct for bias and systemic underestimation of uncertainty

- When evoking risk distributions you should be careful not to anchor the SME at the baseline duration
  - Most schedules are biased towards success, anchoring distributions around the planned finish will result in an unrealistically optimistic analysis
  - Rather than asking for a low and a high around a baseline, ask for a low, most likely, and high
  - The Most Likely value may not be equal to the duration in the schedule.
- When capturing the low and high values, keep in mind that multiple studies including several in the oil/gas field have shown that SMEs tend to capture no more than 60-70% of total uncertainty
  - Built into Polaris is the tri-gen distribution, which automatically adjusts SME provided distributions to account for this fact

26

#### Performing a ICSRA and analyzing the results

Booz | Allen | Hamilton

Booz Allen Hamilton and Client Proprietary and Business Confidential.

#### ICSRA provides unparalleled insights into the drivers of cost and schedule risk and how to mitigate them

- Predict ICSRA provides forecasts for future cost and schedule growth along with many other valuable metrics – allowing project managers to optimize reserve levels and contingency plans
  - Risk adjusted cost estimate, by year, at all levels of the project
  - Risk adjusted schedule estimate, at all levels of the project
  - Probabilistic critical path
  - Combined cost / schedule scatter plots showing the likelihood of meeting both cost and schedule
- Analyze ICSRA prioritizes the sources of cost and schedule growth by days and by dollars at a desired level of certainty, allowing project managers to identify potential mitigative actions
  - Prioritization methods model inputs contributing most to cost and schedule growth including both uncertainties and risks
  - Analysis can be parsed down to all levels of the schedule
- Mitigate ICSRA allows project managers to test out mitigative actions for reducing project cost and schedule growth, and to see their effect
  - Mitigating risks
  - Adding or removing scope
  - Accelerating or decelerating work

#### **Reviewing Critical Path Tree**

50

#### **Scatter Plot with Trend Line and Color to Show Percentiles**

- Purpose, which risks contribute the most days at the P-80 level
- Compute the Baseline with All Risks In
- Iteration # 1: Simulate with each risk disabled in turn, recording the P-80 date
  - The risk with the earliest P-80 date is 1<sup>st</sup> priority
  - Take it out for Iteration # 2
- Iteration # 2: Simulate the remaining risks, disabling each in turn, recording P-80, choose earliest. Take it out for Iteration # 3

#### Prioritize Risks Using Iterative Simulations to Pick Most Important Risks to Schedule

Hulett &

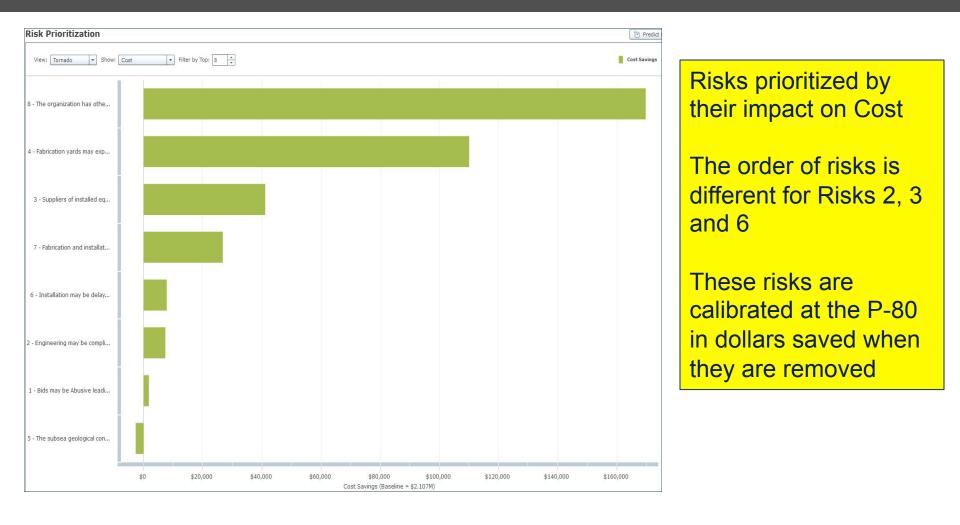

Associates

#### Prioritizing Risk Drivers to Finish First Gas at P-80

	Gas Platform-1 - Risk Prioritization to Schedule (80%)	
		Days
UID	Name	Saved
	The organization has other priority projects so personnel and funding may	
8	be unavailable	99
4	Fabrication yards may experience lower Productivity than planned	32
2	Engineering may be complicated by using offshore design firm	14
7	Fabrication and installation problems may be revealed during HUC	15
3	Suppliers of installed equipment may be busy	10
6	Installation may be delayed due to coordination problems	4
1	Bids may be Abusive leading to delayed approval	0
5	The subsea geological conditions may be different than expected	-2
	TOTAL DAYS SAVED RISK DRIVERS	172
	Uncertainty, estimating error and bias	130
	TOTAL DAYS SCHEDULE CONTINGENCY	302

### **Prioritizing Risks to Cost**

Hulett &

Associates

### Prioritizing Risk Drivers to Total Cost at the P-80 Level

	Gas Platform-1 - Risk Prioritization to Total Cost (80%)	
UID	Name	Cost Saved \$ Millions
	The organization has other priority projects so personnel and funding	
8	may be unavailable	\$169,824
4	Fabrication yards may experience lower Productivity than planned	\$110,115
3	Suppliers of installed equipment may be busy	\$41,135
7	Fabrication and installation problems may be revealed during HUC	\$26,789
6	Installation may be delayed due to coordination problems	\$7,849
2	Engineering may be complicated by using offshore design firm	\$7,357
1	Bids may be Abusive leading to delayed approval	\$1,781
5	The subsea geological conditions may be different than expected	(\$2,669)
	TOTAL COST FROM RISK DRIVERS	\$362,180
	Cost Risk from Uncertainty, Estimating Error / Bias	\$180,000
	TOTAL COST CONTINGENCY RESERVE AT P-80	\$542,180

The program is now ready to address Risk Mitigation

#### **Predict (Gantt View Percent and Color Confidence)**

**Percentile view** allows the user to select their confidence level, represented as a %. By sliding the bar to the left or right, decreasing or raising respectively, the model will display different outputs for start, finish and duration.

Note the Progress Bars exceed the planned start and finish dates noted as Green and Black Dots. **Critical path is outlined in Red. Risks are flagged in the Gantt.** 

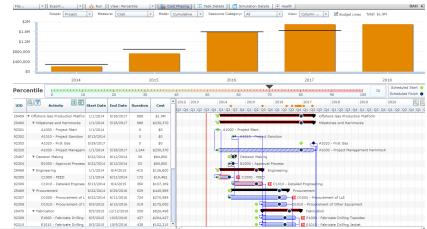

Hulett &

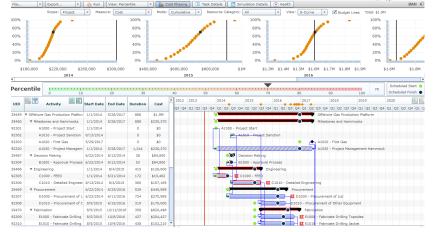

Associates

**Color view** displays the Progress Bars with a color that corresponds to a %. As the confidence % grows the Progress Bars on the Gantt will change colors. **Planned start and finish dates noted as Green and Black Dots** 

#### Predict (Cost Phasing and Resource Utilization)

**Cost Phasing** allows the user to select their confidence level, and then show the projected cost (orange) and current budget (black). This can be displayed as both bar chart, S-Curve, cumulative costs, individual period, project and task. This can be broken down into years, quarters or months in the output

**Resource Utilization Heat Map** displays utilization of resources throughout the project. This can be used to help level resources or forecast where additional resources may be needed.

Under used

Over use
